ProofCSV.

VULTR AGENT RUSH · CSV ANALYST

A question in.
A result you can prove.

A web-based spreadsheet agent that returns executed charts, cleaned files, and the evidence behind its answer.

THE PROBLEM

A plausible answer isn’t enough.

Small teams need useful answers from messy spreadsheets. Chat alone cannot establish that an analysis ran, that its files exist, or that its code stayed inside a safe boundary.

- Manual spreadsheet analysis costs time.
- Generated code can fail or behave unexpectedly.
- Users need results they can inspect and download.

THE PRODUCT

One question. A complete evidence trail.

Upload a CSV → Ask a question → Execute → Inspect and download

- Charts, computed metrics, and cleaned files.
- The actual generated code and execution logs.
- One visible repair attempt using the real error.
- Artifact hashes and verified container cleanup.

THE ARCHITECTURE

Vultr runs the control loop.

Browser ↔ Node.js backend on Vultr VM ↔ Vultr Serverless Inference

Backend → Offline Docker sandbox → Files + logs → Verified report

Inference credentials remain in the backend. The sandbox receives only the CSV, code, and execution limit. It has no network, host mounts, or Docker socket.

THE CONTAINMENT MOMENT

Stop the loop. Destroy the workspace.

The Safety Lab runs an infinite loop with a 3-second allowance. The runner terminates it, the backend destroys the container, and an independent inspection verifies removal.

- 256 MB memory · 0.5 CPU · 64 processes.
- Nonroot execution · read-only root filesystem.
- No network · no host mounts · no credentials.
- A second test probes the isolation boundaries.

VALUE & NEXT STEPS

Useful for the person.
Inspectable for the team.

Built for operators, founders, and analysts who need quick spreadsheet answers and a record of the work behind them.

- Demonstrate a real analysis on Vultr before submitting.
- Record the retry path and the containment moment.
- Future work: authenticated teams, persistent reports, per-user budgets, and stronger runtime isolation.

Local AI and Docker workflow verified. Deploy and validate Vultr hosting and inference before submission.
